

## LAB 6

### Topics: JDBC, Servlet, JSP

1. Write a Java application to store and fetch student registration information (like firstName, lastName, branch, username and password) from a database using JDBC. Practice the use of the following methods of the ResultSet interface: absolute(), afterLast(), beforeFirst(), first(), isFirst(), isLast(), last(), previous(), next(), relative().

\*java application

```
package lab6.q1;

import java.sql.*;
import java.util.Scanner;

public class q1_ans { //Student Registration form
    private static final Scanner sc = new Scanner(System.in);
    public static void print_from_database(Connection con) throws SQLException {
        Statement s = con.createStatement();
        String selectQuery = "select * from `student`";
        ResultSet rs;
        rs = s.executeQuery(selectQuery);
        System.out.println("Printing the Information from Database");
        while (rs.next()) {
            System.out.println(".....");
            System.out.println("Auto id: " + rs.getInt(6));
            System.out.println("First Name: " + rs.getString(1));
            System.out.println("Last Name: " + rs.getString(2));
            System.out.println("Branch: " + rs.getString(3));
            System.out.println("Username: " + rs.getString(4));
            System.out.println("Password: " + rs.getString(5));
            System.out.println(".....");
        }
    }

    public static void insert_in_database(Connection con){
        System.out.println("\n\nInsertion of a Row Started....\nGive proper Inputs");

        try {
            System.out.print("Enter the First Name: ");
            String fname = sc.nextLine();
            System.out.print("Enter the Last Name: ");
            String lname = sc.nextLine();
            System.out.print("Enter the Branch: ");
            String branch = sc.nextLine();
            System.out.print("Enter the Username: ");
            String username = sc.nextLine();
            System.out.print("Enter the password: ");

    } catch (SQLException e) {
        e.printStackTrace();
    }
}
}

```

The screenshot shows an IDE with two files: `q1_ans.java` and `q1_ans_for_usage.java`. The `q1_ans_for_usage.java` file contains the following code:

```

76      System.out.print("Enter the Branch: ");
77      String branch = sc.nextLine();
78      System.out.print("Enter the Username: ");
79      String username = sc.nextLine();
80      System.out.print("Enter the password: ");
81      String password = sc.nextLine();
82      rs.updateString( columnIndex: 1,fname);
83      rs.updateString( columnIndex: 2,lname);
84      rs.updateString( columnIndex: 3,branch);
85      rs.updateString( columnIndex: 4,username);
86      rs.updateString( columnIndex: 5,password);
87      rs.updateRow();
88      System.out.println("Row successfully updated..");
89  }
90
91  1 usage  dhrumilpatel30 *
92  public static void delete_from_database(Connection con) throws SQLException{
93      System.out.print("Delete of row started...\nEnter the id for Delete: ");
94      int id = sc.nextInt();
95      sc.nextLine();
96      Statement s = con.createStatement(ResultSet.TYPE_SCROLL_SENSITIVE, ResultSet.CONCURRENCY_DEFAULT);
97      ResultSet rs = s.executeQuery( sql: "select * from student where id="+id);
98      rs.absolute( row: 1);
99      rs.deleteRow();
100     System.out.println("Row successfully deleted");
101 }
102

2. Write a Java web application for a login module which contains the following components:
  - **index.jsp**: for getting input from the user.
  - **ValidateServlet.java**: a servlet class for validating the user. If it is a valid user (validate from a database using PreparedStatement), it will forward the request to the WelcomeServlet. If the user is not validated then it displays an Error message along with the response from index.html.
  - **WelcomeServlet.java**: a servlet class for displaying the welcome message.

```

<%@ page contentType="text/html; charset=UTF-8" %>
<html>
<head>
    <title>Login Validation page</title>
</head>
<body>
<h1>Login Validation page</h1>
<form action="ValidateServlet" method="post">
    <label>Name
        <input type="text" name="username">
    </label><br><br>
    <label>Password
        <input type="password" name="password">
    </label><br><br>
    <input type="submit" value="Submit">
</form>
</body>
</html>

            }
            else {
                RequestDispatcher rd = request.getRequestDispatcher("/WelcomeServlet");
                rd.forward(request,response);
            }
        } catch (SQLException e) {
            throw new RuntimeException(e);
        }
    }
    // out.println(username+password);
}

@Override
protected void doPost(HttpServletRequest request, HttpServletResponse response) throws
ServletException, IOException {
    doGet(request,response);
}
}

package lab6.q2;

import jakarta.servlet.*;
import jakarta.servlet.http.*;
import jakarta.servlet.annotation.*;

import java.io.IOException;
import java.io.PrintWriter;

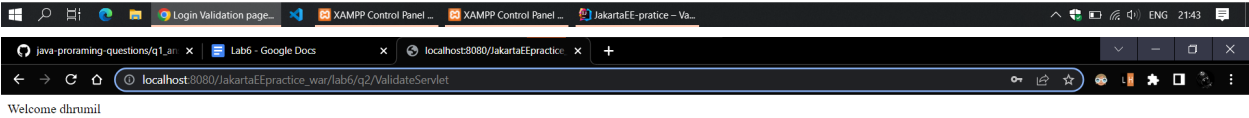

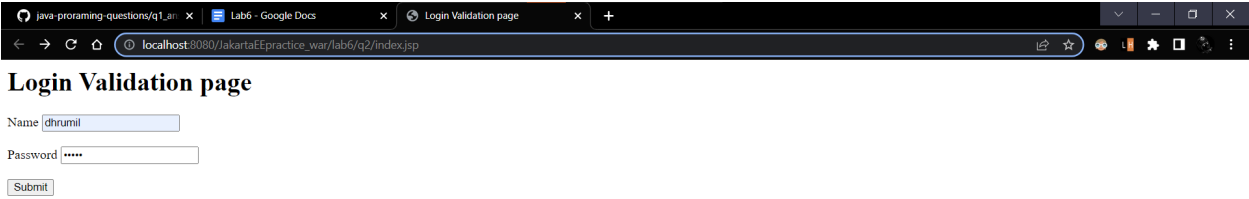

@WebServlet(name = "WelcomeServlet", value = "/WelcomeServlet")
public class WelcomeServlet extends HttpServlet {
    @Override
    protected void doGet(HttpServletRequest request, HttpServletResponse response) throws
ServletException, IOException {
        PrintWriter out = response.getWriter();
        String username = request.getParameter("username");
        out.println("Welcome "+username);
    }

    @Override
    protected void doPost(HttpServletRequest request, HttpServletResponse response) throws

```

```
ServletException, IOException {  
    doGet(request,response);  
}  
}
```

3. Write a web based java application containing a JSP which performs the simple arithmetic calculation. Take the necessary operands and operators in textboxes. Write your JSP code using **jsp:useBean** action tag.

```
<%@ page contentType="text/html; charset=UTF-8" language="java" %>
<html>
<head>
    <title>Calculator</title>
</head>
<body>
<h2>Calculator Using JSP</h2>
<form method="post" action="ans.jsp">
    <label>number 1
        <input type="number" name="a">
    </label>
    <label>number 2
        <input type="number" name="b">
    </label>
    <label><br></br>operation
        <br>+ for sum
        <br>- for sub
        <br>* for multi
        <br>/ for division
        <input type="text" name="operation">
    </label>
    <input type="submit" value="Submit">
</form>

</body>
</html>

<%@ page contentType="text/html; charset=UTF-8" language="java" %>
<html>
<head>
    <title>Ans</title>
</head>
<body>
<jsp:useBean id="obj" class="lab6.q3.Calculator" />
<jsp:setProperty name="obj" property="*" />
<h2>Ans = <%= obj.calc() %></h2>
</body>
</html>

package lab6.q3;

public class Calculator {
    int a;
    int b;
    String operation;
    int ans;
    public int getA() {
        return a;
    }
    public void setA(int a) {
        this.a = a;
    }
    public int getB() {
        return b;
    }
    public void setB(int b) {
        this.b = b;
    }
}
```

```
}
public String getOperation() {
    return operation;
}
public void setOperation(String operation) {
    this.operation = operation;
}
public int getAns() {
    return ans;
}
public void setAns(int ans) {
    this.ans = ans;
}
public int calc(){
    if(operation.equals("+"))return ans=a+b;
    if(operation.equals("-"))return ans=a-b;
    if(operation.equals("*"))return ans=a*b;
    if(operation.equals("/"))return ans=a/b;
    else return ans=-1;
}
}
```

Ans = 37

## Practice Problem

1. Write a Java web application to search a word or phrase on Google search engine. The application should have the following components:

**Search.html:** It contains a textbox to accept search-word or phrase from the user.

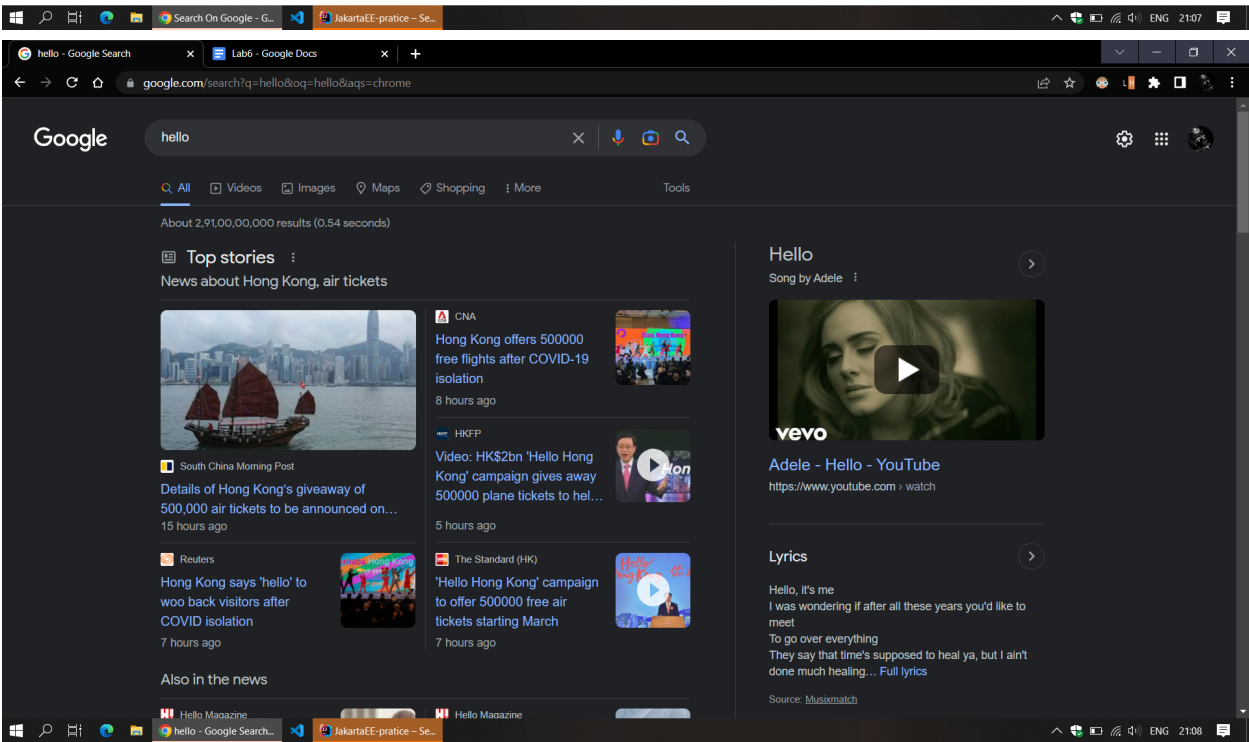

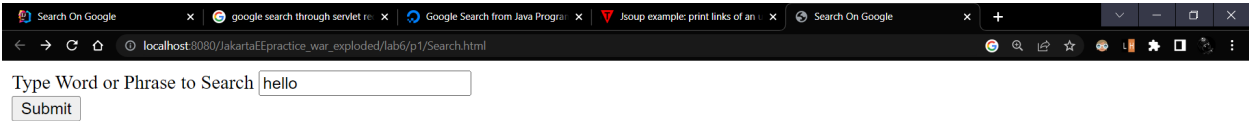

**SearchOnGoogleServlet.java:** It should redirect the search query to Google search engine.

```
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <title>Search On Google</title>
</head>
<body>
<form action="SearchOnGoogleServlet" method="post">
    <label>Type Word or Phrase to Search
    <input type="text" name="search">
    </label><br>
    <input type="submit" value="Submit">
</form>
</body>
</html>

package lab6.p1;

import jakarta.servlet.*;
import jakarta.servlet.http.*;
import jakarta.servlet.annotation.*;
import org.jsoup.Jsoup;
import org.jsoup.nodes.Document;
import org.jsoup.nodes.Element;
import org.jsoup.select.Elements;
import java.io.IOException;
import java.io.PrintWriter;

@WebServlet(name = "SearchOnGoogleServlet", value =
"/lab6/p1/SearchOnGoogleServlet")
public class SearchOnGoogleServlet extends HttpServlet {
    @Override
    protected void doGet(HttpServletRequest request, HttpServletResponse response)
throws ServletException, IOException {
        String searchTerm = request.getParameter("search");
        //PrintWriter out = response.getWriter();
        String searchURL = "https://www.google.com/search?q="+searchTerm;
        Document doc = Jsoup.connect(searchURL).userAgent("Mozilla/5.0").get();
        String search = doc.select("a[href]").get(1).attr("href");
        response.sendRedirect("https://www.google.com"+search);
    }
    @Override
    protected void doPost(HttpServletRequest request, HttpServletResponse response)
throws ServletException, IOException {
        doGet(request,response);
    }
}
```

2. Write a Java web application to demonstrate usage of JSP Scripting Elements (Scriptlet, Expression, Declaration) and JSP implicit objects (out, request, response.) Use method post to submit a feedback form (html) (Full Name, Email, Subject, Message) to a jsp page and let the jsp page preview the same as the confirmation page with additional text “Feedback received. Thank you.”

```
<%@ page contentType="text/html; charset=UTF-8" language="java" %>
<html>
<head>
    <title>FeedBack Form</title>
</head>
<body>
<h1>FeedBack Form</h1>
<form method="post" action="result.jsp">
    <label>Full Name:
        <input type="text" name="name">
    </label><br><br>
    <label>Email:
        <input type="email" name="email">
    </label><br><br>
    <label>Subject:
```

```
        <input type="text" name="subject">
    </label><br><br>
    <label>Message:
        <textarea name="msg"></textarea>
    </label>
    <input type="submit" value="submit">
</form>
</body>
</html>
```

```
<%@ page contentType="text/html; charset=UTF-8" language="java" %>
<html>
<head>
    <title>Form</title>
</head>
<body>
<h2>Feedback received. Thank you.</h2>
<%-- Declaration --%>
<%! String name;%>
<%! String email;%>
<%! String subject;%>
<%! String message;%>
<%-- Scriptlet --%>
<%
    name = request.getParameter("name");
    email = request.getParameter("email");
    subject = request.getParameter("subject");
    message = request.getParameter("msg");
%>
<%-- Expression --%>
<h2>Preview of Submitted form</h2>
<h3>Name: <%= name%></h3>
<h3>Email: <%= email%></h3>
<h3>Subject: <%= subject%></h3>
<h4>Message: <%= message%></h4>
<%
    out.print("If You want to submit another form: ");
    out.println("<a href='index.jsp'>Click Here</a>");
    Cookie[] coks = request.getCookies();
    String cnt = null;
    int count;
    if(null != coks){
        for (Cookie c : coks) {
            if(c.getName().equals("cnt"))cnt=c.getValue();
        }
    }
    if(null == cnt)count = 0;
    else { count = Integer.parseInt(cnt);}
    Cookie cnew = new Cookie("cnt",String.valueOf(count+1));
    if(0 == count)cnew.setMaxAge(60*60*24);
    response.addCookie(cnew);
%>
<h3>Number of Forms Submitted Today:<%= count + 1%></h3>
</body>
</html>
```

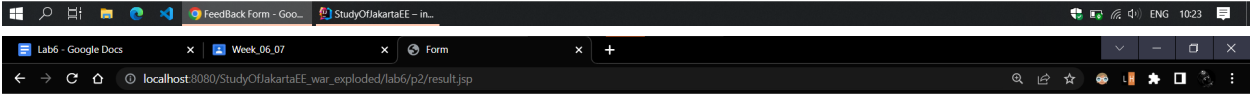

# FeedBack Form

3. Write a web based java application that contains a scriptless JSP which works like a unit convertor. (Hint: create a bean to do calculations)

<b>a) Length</b> Meter ↔ Centimeter Inch ↔ Centimeter	<div>Length ▾</div> <div><div>1</div><div>=</div><div>100</div></div> <div><div>Metre ▾</div><div>Centimetre ▾</div></div>
<b>b) Temperature</b> Celsius ↔ Fahrenheit	

```
<%@ page contentType="text/html; charset=UTF-8" language="java" %>
<html>
<head>
    <title>Converter</title>
</head>
<body>
<h1>Unit Converter</h1>
<form action="calculate.jsp" method="post">
    <label>Select:</label>
    <select name="data">
        <option value="length">Length</option>
        <option value="temp">Temperature</option>
    </select><br>
    <label>From unit value: <input type="number" name="from_value"></label>
    <select name="from_unit">
        <option value="meter">Meter</option>
        <option value="inch">Inch</option>
        <option value="celsius">Celsius</option>
    </select><br>
    <h3>—1 represents wrong combination</h3>
    <label>To unit value: <h2><% String ans =
request.getParameter("ans");if(ans≠null)out.print(ans);%></h2></label>
    <select name="to_unit">
        <option value="centimeter">centimeter</option>
        <option value="fahrenheit">Fahrenheit</option>
    </select>
    <input type="submit" value="Submit">
</form>
</body>
</html>

<%@ page contentType="text/html; charset=UTF-8" language="java" %>
<html>
<head>
    <title>Nope</title>
</head>
<body>
<jsp:useBean id="con" class="lab6.p3.Converter" scope="application" />
<jsp:setProperty name="con" property="*" />
<%
    double ans = con.getAns();
    response.sendRedirect("index.jsp?ans="+ans);
%>
</body>
</html>
```

```

package lab6.p3;

public class Converter {
    private String data;
    private String from_unit;
    private String to_unit;
    private int from_value;
    public String getData() {
        return data;
    }

    public void setData(String data) {
        this.data = data;
    }

    public String getFrom_unit() {
        return from_unit;
    }

    public void setFrom_unit(String from_unit) {
        this.from_unit = from_unit;
    }

    public String getTo_unit() {
        return to_unit;
    }

    public void setTo_unit(String to_unit) {
        this.to_unit = to_unit;
    }

    public int getFrom_value() {
        return from_value;
    }

    public void setFrom_value(int from_value) {
        this.from_value = from_value;
    }

    public double getAns(){
        if(data.equals("length") && from_unit.equals("meter") && to_unit.equals("centimeter")){
            return from_value*100;
        } else if (data.equals("length") && from_unit.equals("inch") &&
to_unit.equals("centimeter")) {
            return from_value*2.54;
        } else if (data.equals("temp") && from_unit.equals("celsius") &&
to_unit.equals("fahrenheit")) {
            return (from_value*9/5)+32;
        }
        else {
            return -1;
        }
    }
    //    return data+from_unit+to_unit+from_value;
}
}
